

How to check SQL Server 2008 is running or not in your computer?

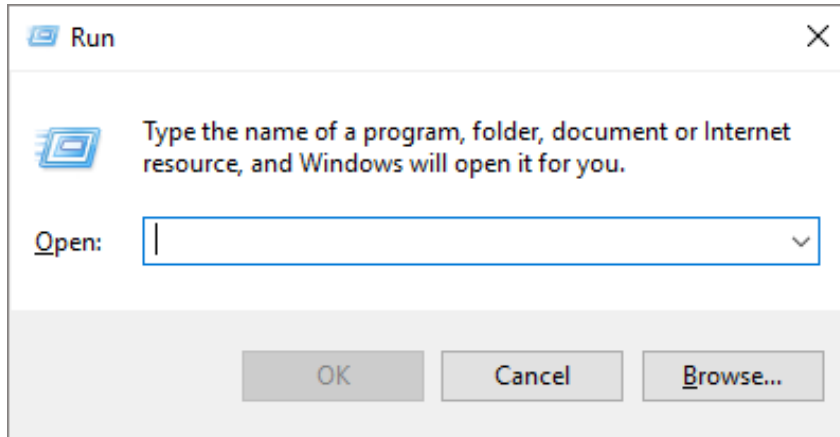

HDPOS smart Tutorials

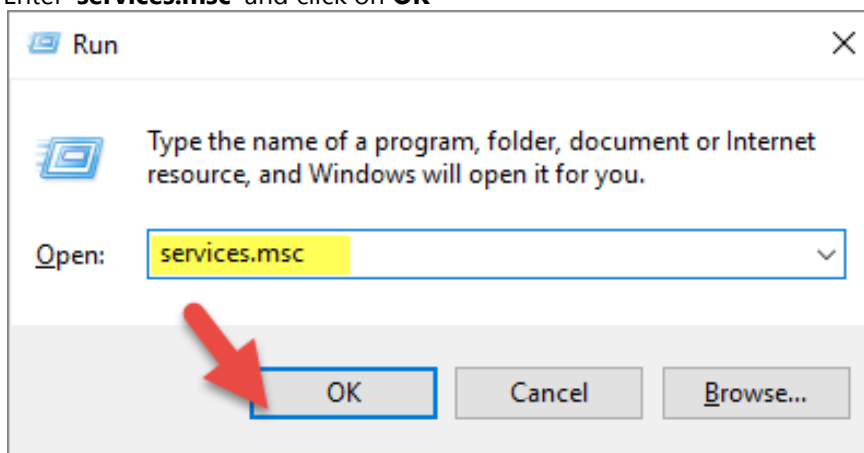

You would not be able to start your HDPOSsmart application if the SQL server service is not running on your computer.

To check and start the SQL server services on your computer, please follow the steps below:

1. Press **Win +R** keys (or goto **Start** and select **Run**) to open the **Run** dialog box

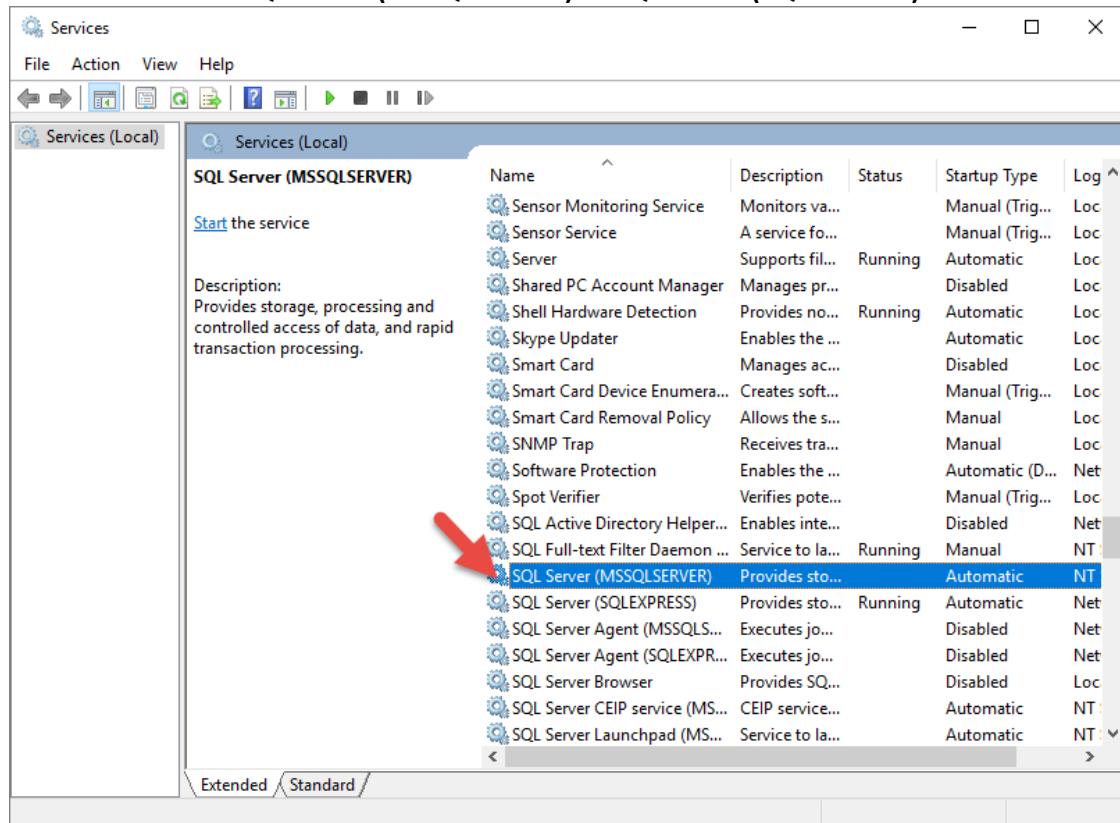

2. Enter '**services.msc**' and click on **OK**

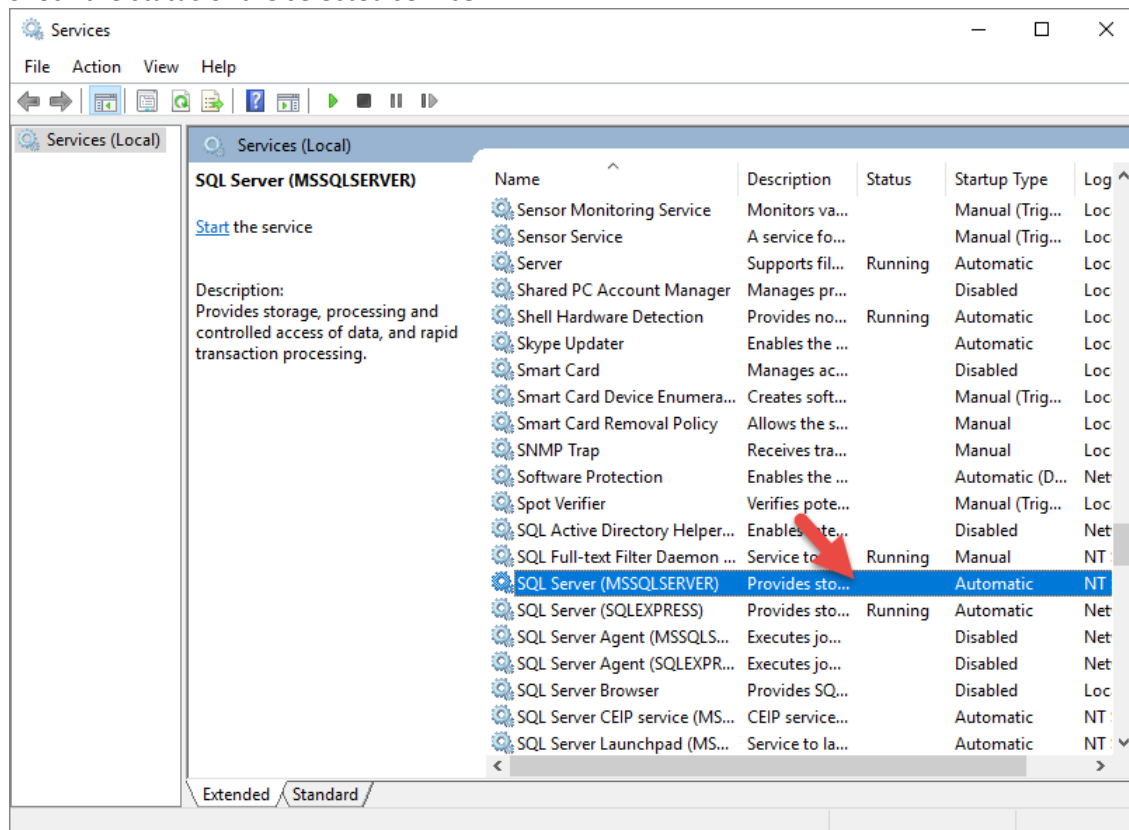

- 3. Look for SQL Server services in the services window
The name could be **SQL Server (MSSQLSERVER)** or **SQL Server (SQLEXPRESS)**

- 4. Check the status of the selected service

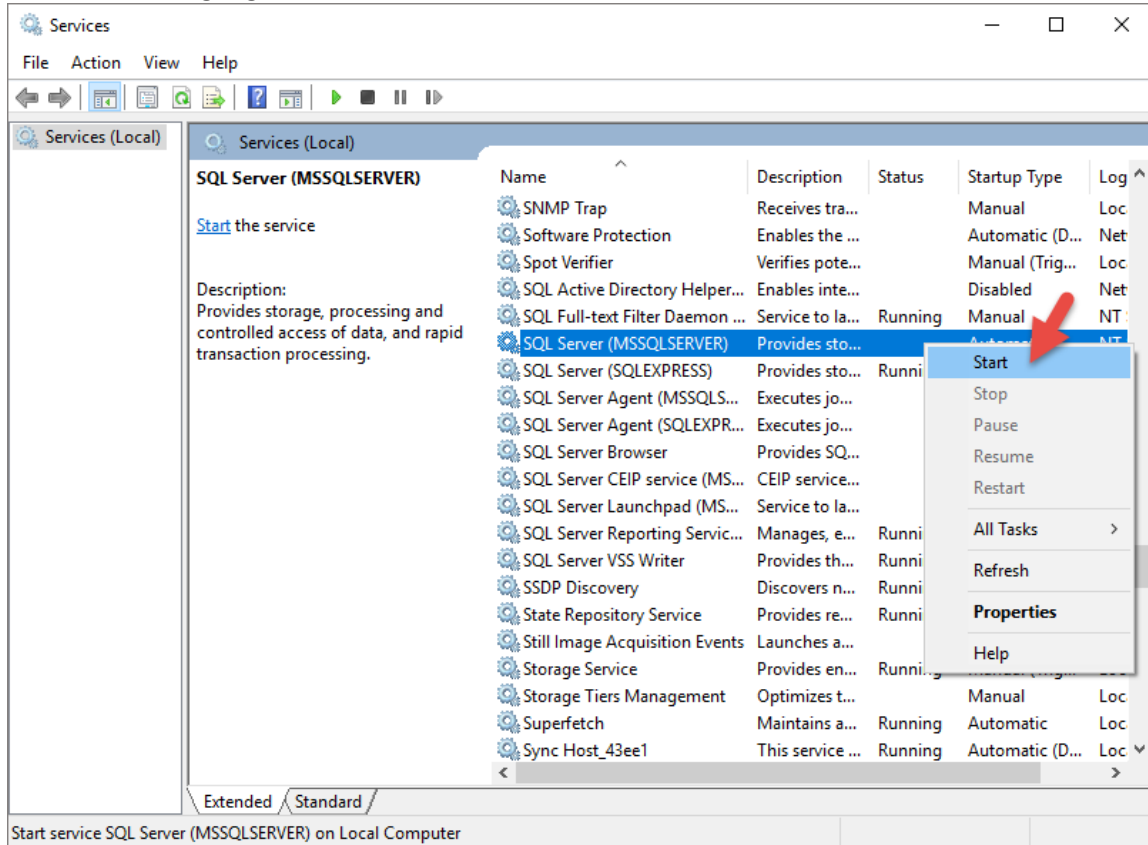

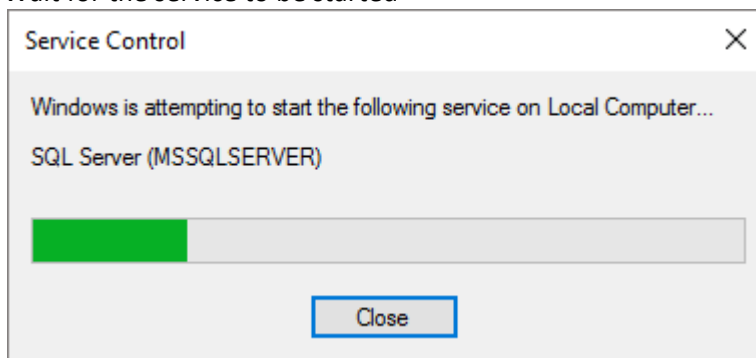

- a. The status is displayed blank if the service is not running
- b. If the service is running, the status is displayed as **‘Running’** or **‘Started’**

Note: The status is displayed as ‘Running’ in Windows 8 and Windows 10, whereas the status is displayed as ‘Started’ in Windows XP and Windows 7.

5. If it is not running, right-click on the service, and click on **Start**

6. Wait for the service to be started

7. Make sure the status is changed to **Running** or **Started**

The screenshot shows the Windows Services console. The 'SQL Server (MSSQLSERVER)' service is selected and highlighted in blue. A red arrow points to the 'Running' status in the 'Status' column. The table below lists the services and their details.
